Gideros Guide for Pushwoosh Plugin

Copy files to the respective directory on exported Gideros project.

Copy < Gideros Installation Directory > \Sdk \include to jni \sdk \include

Create **Android.mk** file in **<**Gideros Installation Directory**>**\Sdk\include to jni and write the following:

```
LOCAL_PATH := $(call my-dir)

# # Gideros Shared Library
# include $(CLEAR_VARS)

LOCAL_MODULE := gideros
LOCAL_SRC_FILES := ../libs/$(TARGET_ARCH_ABI)/libgideros.so

include $(PREBUILT_SHARED_LIBRARY)

# Lua Socket Library
# include $(CLEAR_VARS)

LOCAL_MODULE := luasocket
LOCAL_SRC_FILES := ../libs/$(TARGET_ARCH_ABI)/libluasocket.so

include $(PREBUILT_SHARED_LIBRARY)

# Lua File System Library
# include $(CLEAR_VARS)

LOCAL_MODULE := lfs
LOCAL_MODULE := lfs
LOCAL_SRC_FILES := ../libs/$(TARGET_ARCH_ABI)/liblfs.so

include $(PREBUILT_SHARED_LIBRARY)
```

Add the following to Android.mk file

```
#
# PushWoosh Plugin
#
include $(CLEAR_VARS)

LOCAL_MODULE := pushwoosh
LOCAL_ARM_MODE := arm
LOCAL_CFLAGS := -02
LOCAL_C_INCLUDES += $(LOCAL_PATH)/sdk/include
```

```
LOCAL_SRC_FILES := pushwoosh/gpushwoosh.cpp
pushwoosh/pushwooshbinder.cpp
LOCAL_LDLIBS := -ldl -llog
LOCAL_SHARED_LIBRARIES := gideros

include $(BUILD_SHARED_LIBRARY)
```

In the **AndroidManifest.xml** make the following changes, Replace YourStartActivity with the name of your activity and PACKAGE NAME with the package name for your application.:

Add the following changes in your **AndroidManifest.xml** under **manifest** tag. Replace PACKAGE_NAME with the package name for your application.

```
<uses-permission android:name="android.permission.ACCESS NETWORK STATE"/>
<uses-permission android:name="android.permission.READ PHONE STATE"/>
 <!--library-->
 <uses-permission android:name="android.permission.READ PHONE STATE"/>
 <!-- GCM connects to Google Services. -->
 <uses-permission android:name="android.permission.INTERNET"/>
 <!-- GCM requires a Google account. -->
 <uses-permission android:name="android.permission.GET ACCOUNTS"/>
 <!-- Keeps the processor from sleeping when a message is received. -->
 <uses-permission android:name="android.permission.WAKE LOCK"/>
 <!--
 Creates a custom permission so only this app can receive its messages.
 NOTE: the permission *must* be called PACKAGE.permission.C2D MESSAGE,
        where PACKAGE is the application's package name.
 -->
 <permission</pre>
         android:name="PACKAGE NAME.permission.C2D MESSAGE"
         android:protectionLevel="signature"/>
 <uses-permission</pre>
        android:name="PACKAGE NAME.permission.C2D MESSAGE"/>
```

Add the following changes in your **AndroidManifest.xml** under **application** tag. Replace PACKAGE NAME with the package name for your application.

```
<activity android:name="com.arellomobile.android.push.PushWebview"/>
<activity android:name="com.arellomobile.android.push.MessageActivity"/>
<activity android:name="com.arellomobile.android.push.PushHandlerActivity"/>
<!--
 BroadcastReceiver that will receive intents from GCM
  services and handle them to the custom IntentService.
 The com.google.android.c2dm.permission.SEND permission is necessary
 so only GCM services can send data messages for the app.
<receiver
       android:name="com.google.android.gcm.GCMBroadcastReceiver"
        android:permission="com.google.android.c2dm.permission.SEND">
    <intent-filter>
        <!-- Receives the actual messages. -->
       <action android:name="com.google.android.c2dm.intent.RECEIVE"/>
       <!-- Receives the registration id. -->
       <action android:name="com.google.android.c2dm.intent.REGISTRATION"/>
       <category android:name="PACKAGE NAME"/>
    </intent-filter>
</receiver>
<!--
 Application-specific subclass of PushGCMIntentService that will
 handle received messages.
<service android:name="com.arellomobile.android.push.PushGCMIntentService"/>
```

If you would like to use Geo Push Notifications add the following service to your manifest file:

```
<!--
   Service for sending location updates
-->
<service android:name="com.arellomobile.android.push.GeoLocationService"/>
```

Now modify the main activity of your Gideros project. Add following import statement:

import com.nightspade.gideros.android.plugins.pushwoosh.GPushWoosh;

Add:

```
System.loadLibrary("pushwoosh");

just right after:

System.loadLibrary("gideros");
System.loadLibrary("luasocket");
System.loadLibrary("lfs");

And add Plugin class inside externalClasses like that:

static private String[] externalClasses = {
    "com.nightspade.gideros.android.plugins.pushwoosh.GPushWoosh");

And add

@Override
public void onNewIntent(Intent intent) {
        super.onNewIntent(intent);
        GPushWoosh.checkMessage(intent);
}
```
